

## 5.12 Team Deliverable 4: Individual Reflection (Sprint 1)

Name: Nick Dubauskas

Github ID: ndubausk

Group Name: Crack-Those-Macros

What you planned to do:

- Create User form to fill out their dietary goals
- Save the form answers to our backend
- Store the form answers to the specific User

What you did not do:

- Store the form answers to the Database per each user

What problems you encountered:

- Learning React and JS and how it works with Python

Issues Completed:

- As a user, I would like to fill out a form, so that I can share my fitness and dietary goals
- As a user, I would like my form information collected, so that it can be used to define my results

Files you worked on:

- Questionnaire.js
- UserQuestionnaire.py
- User Table for database

What you accomplished:

Using React, I created a simple form for users to fill out to determine their initial dietary goals. This is a crucial initial step to get the correct data to run our algorithm to choose the proper meals.

Using Python, I saved the user's answers from the form and placed them into a User Class to save to the database.

Added extra columns for the questionnaire on the User Table
